

Residential Hotspot Application

LOHAS PARK— “Life of Health and Sustainability” is the new idea of MTR new development located near Clear Water Bay Country Park. “LOHAS is luxury redefined. It is the pursuit of personal satisfaction through chic, stylish living and satisfy the increasing demands of Hong Kong residents for high quality living.”

LOHAS PARK is different then other developments in personal information technology and Internet access. For example, residents are directly connecting to the Internet with LOHAS’s dedicated high bandwidth network, integrated with other purposed switching networks and personal storage. Wi-Fi is also provided for Internet surfing inside club house and platform garden.

To building up a robust and substantial Wi-Fi network, about 600 meter of high quality coaxial cable has been used in LOHAS PARK phase one at the last 80 meters between the access point and the antenna system to minimize the number of access point used.

The hotspot system is also different then general hotspot application that required a operator to manually generate account for user/customer. Instead, the new hotspot could provide both fix accounts and distanced label printers and generate account with two buttons on the printer. This provide the greatest flexibility and cost saving value.
